

Aqui esta solo falta tomar foto de la app para el vierenes 5pm

Postula PRO

1. Project Overview

Project Name: Postula Pro

Project Type: Web application and Chrome extension

Purpose:

1. Postula Pro is an application designed to save users time when filling out online job applications. Many job application websites use resume parsers, but they often miss important information or fill fields incorrectly. This creates frustration because applicants still have to manually retype the same information repeatedly.

2. The goal of Postula Pro is to make the job application process faster, easier, and less stressful by allowing users to create saved job application profiles, called personas. Each persona can be tailored to a different type of job, such as IT, drafting, customer service, insurance, or another career path.

3. The user uploads a resume, and AI is only used to help parse the resume information at the beginning. After that, the user can manually review, edit, and perfect the information for each persona. Once the persona is ready, the Chrome extension can help autofill repetitive job application fields across supported websites.

2. Problem Statement

1. Applying for jobs online can be time-consuming and frustrating. Many applications ask for the same information over and over again, even after the user uploads a resume. Resume parsers often fail to correctly extract details such as work history, education, skills, phone numbers, addresses, and custom questions.

2. This becomes especially frustrating when applicants are trying to apply to many jobs per week. For example, applying to 25 jobs in a week can feel like a part-time job by itself. Users may experience burnout, guilt, or discouragement when they cannot complete enough applications.

3. Another issue is that people often apply for different types of jobs. A single general resume is not always the best option. Applicants are commonly advised to personalize their resume and application details depending on the job. Postula Pro solves this by allowing users to create different personas for different job categories.

3. Project Goals and Objectives

The main goal of Postula Pro is to reduce the repetitive work involved in online job applications.

The objectives are:

• Allow users to upload a resume and extract basic information using AI.

• Let users manually edit and perfect their saved profile information.

• Allow users to create multiple personas for different job types.

• Build a Chrome extension that detects application fields and fills them automatically when possible.

• Reduce the time and stress involved in applying to jobs.

• Support users who want to apply to U.S. jobs, including people in Mexico and Chile looking for remote opportunities.

4. Target Users

The primary users for Postula Pro are job seekers who apply to many jobs online and want to save time.

Potential users include:

• Students applying for internships.

• Recent graduates applying for entry-level jobs.

• People switching careers.

• Remote job seekers.

• People applying to U.S. jobs from other countries.

• Workers with multiple types of experience, such as IT, drafting, customer service, or sales.

A major target audience for the future version is people in Mexico and Chile who want to apply for U.S.-based remote jobs. Many of these users may have the skills needed but struggle with repetitive applications, English-language forms, or knowing how to present their experience professionally.

5. System Scope

The first version of Postula Pro will focus on the core job application autofill process.

• Included in Scope

• User account system.

• Resume upload.

• AI-assisted resume parsing.

• Manual profile editing.

• Persona creation.

• Saved contact information.

• Saved work history.

• Saved education.

• Saved skills.

• Saved job preferences.

• Chrome extension autofill functionality.

• Basic dashboard for managing personas.

• Not Included in First Version

• Full AI resume writing service.

• Automatic job searching.

• Automatic job submitting without user review.

• Guaranteed compatibility with every job website.

• Automatic answering of complex custom questions.

The first version will focus on making repetitive applications easier, while still keeping the user in control.

6. Requirements

Functional Requirements

The system should allow users to:

• Create an account.

• Log in securely.

• Upload a resume.

• Have the resume parsed into structured fields.

• Manually edit all parsed information.

• Create different personas for different job types.

• Save contact information, work history, education, skills, and experience.

• Select which persona they want to use.

• Use a Chrome extension to autofill application forms.

• Review autofilled information before submitting an application.

Non-Functional Requirements

The system should be:

• Easy to use.

• Secure.

• Fast enough to reduce application time.

• Organized with a clean dashboard.

• Reliable across common job application websites.

• Designed with privacy in mind.

• Simple enough for non-technical users.

7. System Design

Postula Pro will have two main parts:

• Web Application

• The web app is where users manage their account, upload resumes, edit information, and create personas.

• Chrome Extension

• The Chrome extension is used while the user is on a job application website. It reads the form fields and fills in matching information from the selected persona.

• Basic Workflow

• User creates an account.

• User uploads resume.

• AI parses the resume into basic structured information.

• User reviews and edits the information.

Postula Pro Page 1

- User creates one or more personas.
- User selects a persona.
- User goes to a job application website.
- Chrome extension detects form fields.
- Extension autofills matching fields.
- User reviews the application and submits it manually.

8. Persona Feature

One of the main features of Postula Pro is the persona system.

A persona is a saved version of the user's professional profile tailored to a specific job type. For example, one user could create:

- IT Persona for help desk or technical support jobs.
- Drafting Persona for AutoCAD or construction drafting jobs.
- Customer Service Persona for support or call center jobs.
- Insurance Persona for insurance-related applications.

Each persona can have different skills, summaries, and possibly different resume files. This helps users apply to different industries without constantly rewriting the same information.

The persona system is important because modern job applications often reward targeted resumes and specific experience. Instead of using one general profile for every job, Postula Pro helps the user stay organized and apply with the most relevant version of their background.

9. Development Progress and Notes

1. At the beginning, the idea was simple: create an autofill tool for job applications. The original motivation came from the frustration of applying to jobs manually. Applying to even five jobs felt exhausting, and applying to 25 jobs per week seemed unrealistic without some kind of assistance.
2. After thinking more about the problem, the idea expanded. Instead of only being a basic autofiller, Postula Pro became a more organized system with personas. This made the project stronger because users often apply to different types of jobs and need different versions of their professional profile.
3. The workflow was not necessarily difficult, but it took time to organize the ideas. The hardest technical part is figuring out how the Chrome extension will recognize different form fields across different websites. Every job website structures forms differently, so the extension needs to identify fields like name, email, phone number, work history, education, and skills as accurately as possible.
4. Another challenge was competition. There are already autofill and job application tools available, so Postula Pro needs to offer something different. The persona system and the focus on helping international users apply to U.S. jobs are two ways the project can stand out.
5. The user interface also went through several design ideas. It was difficult to settle on one design because the application needs to feel professional, modern, and simple. After several iterations, a final direction was chosen.

10. Challenges Encountered

Some challenges identified during the project include:

- Technical Challenges
- Making the Chrome extension work on different job websites.
- Matching saved persona data to form fields correctly.
- Handling websites that block autofill or use unusual form structures.
- Deciding how much AI should be used.
- Keeping user data secure.
- Design Challenges
- Creating a clean and professional UI.
- Making the persona system easy to understand.
- Avoiding too many confusing options.
- Designing for users who may not be very technical.
- Business Challenges
- Competing with existing autofill tools.
- Creating a feature that feels unique.
- Deciding on pricing.
- Explaining the value clearly to users.
- Building trust because the app handles personal career information.

- Heres the first design but although it looks so appy or apple to be exact it needed some design or some personality imo .

- This is the final decision I came to , nice tailwind css ui kits to bring it all together and might even iterate some different nav bars

- This is the section right under the hero and it just looks like a job board off the bat and I like that because it sells what it is used for. It ties together with trusted brands so it's easy to confuse or just persuade .

11. Decisions Made

Several important decisions were made during the planning process:

- AI will only be used for resume parsing.
- This keeps the system focused and reduces the risk of AI generating inaccurate information.
- Users will manually review and edit their data.
- This gives users control and helps make the information more accurate.
- The system will use personas.
- This makes the app more useful for people applying to different types of jobs.
- The extension will assist with applications, not fully submit them automatically.
- The user should still review and submit the application themselves.
- The first version will focus on core autofill features.
- More advanced features can be added later.

12. Possible Technologies

The system could be built using:

- Frontend: React, Vite, Tailwind CSS
- Backend/Database: Supabase
- Authentication: Supabase Auth
- Payments: Stripe
- Extension: Chrome Extension using JavaScript
- AI Parsing: OpenAI API or another resume parsing method
- Hosting: Netlify, Vercel, or another web hosting platform

These technologies would allow the project to be built as a modern web application with a connected browser extension.

13. Deliverables

The expected deliverables for the project include:

- Project notebook.
- System concept and requirements.
- Basic UI prototype.
- Persona dashboard design.
- Resume upload and parsing concept.
- Chrome extension concept.
- Presentation slides.
- Final presentation.
- Notes after presentation.

If time allows, the project could also include a working prototype that demonstrates a saved persona autofilling basic form fields.

so I have the old render here in vercel , [SudoFillr - AI-Powered Job Application Autofill | Save Hours on Applications](#) but as seen tthat's SudoFillr not PostulaPro . [PostulaPro - AI-Powered Job Application Autofill | Save Hours on Applications](#)

14. Future Improvements

Future versions of Postula Pro could include:

- Cover letter generation.
- Resume file management.
- Job tracking dashboard.
- Application history.
- Saved answers for common application questions.
- Support for Spanish-speaking users.
- Better support for international users applying to U.S. jobs.
- AI suggestions for improving persona information.
- Browser support beyond Chrome.
- Team or career coach features.

A future version could also help users from Mexico and Chile prepare professional U.S.-style application profiles, especially for remote work.

15. Retrospective / Lessons Learned

1. One lesson learned from this project is that a simple problem can become a larger system once the workflow is analyzed. At first, the idea was only to autofill job applications. After thinking about the real user problem, it became clear that users need more than just autofill. They need organization, customization, and control over their job application information.
2. Another lesson is that competition can be useful because it forces the project to become more unique. Instead of copying existing autofill tools, Postula Pro can focus on personas, user control, and international remote job seekers.
3. The most difficult part of the project is the Chrome extension because websites are not all built the same way. The system will need to be tested on different job application websites to improve accuracy.
4. Overall, Postula Pro is a practical system because it solves a real problem: job application burnout. It helps users save time, stay organized, and apply to more jobs without feeling overwhelmed.

16. Pros and Cons After Presentation

- Pros
- The idea solves a real-world problem.
- The persona system makes the project more unique.
- The app could help students, job seekers, and remote workers.
- The project has room to grow into a real business.
- The system can start simple and improve over time.
- Cons
- Building a Chrome extension can be technically challenging.
- Not every job website will be easy to support.
- Users may worry about privacy.
- The project needs a clean design to avoid feeling complicated.
- There is competition in the job application tool market.

17. Conclusion

Postula Pro is a job application productivity system designed to reduce repetitive work and help users apply to jobs more efficiently. By combining resume parsing, manual editing, personas, and Chrome extension autofill, the system gives users more control over their application process.

The project is useful because many job seekers struggle with application fatigue and repeated data entry. Postula Pro aims to make the process easier without fully removing the user's control. The first version will focus on building the main system and proving that persona-based autofill can save time for job seekers.
