SUDO FILLR

AUTOFILLER AND MORE

A browser extension designed to bridge the gap between your static resume and dynamic web forms. Sudofillr eliminates repetitive data entry and context errors, reducing application time from minutes to seconds

About SudoFillr

Intelligent Automation for the Modern Job Seeker

Sudofillr bridges the gap between your static resume and dynamic web forms. Unlike standard autofillers that guess, our Multi-Persona Engine lets you switch between different skillsets and resumes instantly.

We also solve the localization nightmare. Sudofillr is built for the Americas, with dedicated support for Chilean and Mexican form standards (RUT, Colonias) and automated Cover Letter generation. It's the first tool that adapts to where you are applying and who you need to be for that specific job.

Our Mission

We concentrate on completing your project's objectives

The modern hiring process is fundamentally broken. Talented individuals spend more time fighting with repetitive forms than showcasing their skills. Sudofillr exists to eliminate this 'application fatigue.' We automate the tedious data entry workflow, transforming a frustrating 20-minute struggle into a seamless, single-click experience.

We believe privacy is a right, not a feature. In an era where free tools harvest user data, Sudofillr stands apart. We operate on a strict 'User-Sovereignty' model. Your personal data is encrypted, never sold, and never shared. You retain full control to wipe your data from our servers instantly, at any time.

Bridging the Global Gap

Geography should not dictate opportunity. We are specifically dedicated to empowering skilled professionals in Mexico and Chile. Our goal is to connect LATAM talent with the global remote job market, leveling the playing field for developers everywhere.

Removing Language Barriers

Skill is universal; language shouldn't be a blocker. Sudofillr helps navigate complex English-first application systems, ensuring that language differences never stop a qualified developer from landing their dream remote job.

Objective Core

Efficiency

To drastically reduce user friction in the hiring process. By automating the redundant entry of work history and education data, Sudofillr transforms a 20-minute application task into a single-click action, respecting the user's time and mental energy

Precision

To guarantee data integrity across diverse platforms. Unlike standard browser tools that rely on guesswork, Sudofillr enforces a strict 'Professional Only' data schema. This ensures no personal metadata (gamertags, old emails) ever pollutes a job application

Adaptability

To provide context-aware assistance. The system recognizes that users are multifaceted, offering dynamic 'Persona Switching' for different career paths and automatic localization for Latin American markets (Chile/Mexico) where standard tools fail.

DEVELOPMENT ROADMAP

Requirements Gathering

± 15 Days

Analyze the failure points of current browser autofillers, specifically 'zombie data' (old phone numbers) and context blindness (Twitch usernames in name fields). Define the schema for the 'Master Resume' JSON structure and identify specific localization requirements for Chile (RUT) and Mexico.

System Design & Architecture

± 15 Days

Develop the dual-interface ecosystem: a Next.js Web Dashboard for resume management and a Chrome Extension for field injection.

Implementation & Testing

± 20 Days

Develop the core WebExtension using JavaScript and Manifest V3. Implement the regex logic for Latin American field validation. Conduct 'Live Fire' testing on major Applicant Tracking Systems (Workday, Greenhouse, Taleo) to ensure 100% field accuracy before release.

SudoFillr.

Estimated Budget

Department	Hourly Rate	Hour	Total
Requirements & Analysis	\$45	20	\$900
System Architecture	\$65	15	\$975
UI/UX Design	\$50	25	\$1,250
Full-Stack Development	\$75	80	\$6,000
QA & Localization Testing	\$40	30	\$1,200
API Integration (OpenAI)	\$55	10	\$550
Estimated Total			\$10,875

Project Proposal: Sudofillr – Fixing the Application Workflow

This proposal requests approval for the development of "Sudofillr," a comprehensive system designed to finally solve the frustration of online job applications. The current landscape for job seekers is broken. We are forced to rely on browser autofillers that are context-blind, inaccurate, and hopelessly outdated. These tools frequently ruin professional applications by pasting gaming usernames, old phone numbers, or irrelevant emails into critical fields. Sudofillr is the solution to this chaos. It is a browser extension and web dashboard ecosystem that prioritizes user intent over historical guesswork, ensuring that the data submitted is always accurate, professional, and secure.

The core reason this system is necessary is that current technology is failing the user. Most browsers treat every text field the same, unable to distinguish between a Twitch signup form and a corporate career portal. This leads to embarrassing errors where a user's professional image is compromised by their personal browsing history. Furthermore, these browsers hoard "zombie data"—phone numbers from ten years ago or addresses from three moves ago—that the user is constantly forced to delete and overwrite. The most painful friction point, however, occurs on Applicant Tracking Systems (ATS). Users are asked to upload a resume for parsing, yet the system consistently fails to extract the data correctly, forcing candidates to manually re-type their entire work history. This redundancy is not just annoying; it is a waste of human potential.

Sudofillr is designed to be the "smart layer" that standard browsers lack. Instead of guessing, it operates on a strict "Master Resume" model. The system understands that users are not one-dimensional; they have different skills for different opportunities. The software allows users to manage multiple "Personas"—such as a Creative Profile versus a Technical Profile—and instantly inject the correct skillset, bio, and experience into a form with a single click.

Crucially, Sudofillr addresses the global nature of remote work. Standard US-centric tools break when they encounter forms from Latin America. My system includes dedicated logic for Chilean and Mexican standards, correctly handling fields like the Chilean RUT or Mexican address subdivisions that Google Chrome consistently mishandles. We are also automating the creative struggle of the "About Me" section by using generative AI to draft cover letters that are tailored to the specific job description, removing language barriers for skilled developers in LATAM who deserve a fair shot at global roles.

From a technical standpoint, we are moving beyond simple local storage to a robust, cloud-hybrid architecture. The system consists of two parts: a Next.js Web Dashboard for managing data and a Chrome Extension for executing the autofill. We will utilize Supabase to handle real-time database syncing and authentication, ensuring that if a user updates their resume on the dashboard, the extension is updated instantly. The backend will integrate with OpenAI's API to parse uploaded resumes and power the generative text features.

Most importantly, this architecture is built on a foundation of absolute privacy. Unlike free tools that harvest and sell user data, Sudofillr operates on a "User-Sovereignty" model. We believe privacy is a right, not a feature. Users retain full ownership of their information and have the

power to completely wipe their data from our servers at any moment. We do not share, sell, or retain data without explicit consent.

I am proposing Sudofillr because the technology currently available to us is insufficient. It creates work instead of saving it. This project represents a high-value opportunity to build a tool that respects the user's time and intelligence. By solving the specific pain points of outdated data, context errors, and regional incompatibility, we can empower developers especially those in Mexico and Chile to navigate the remote job market with confidence. I request permission to proceed with the development of the prototype immediately. (I already have started it , and in production . close to testing .)
